

AI-Quantum Co-Design

Two tools with opposite strengths. Run as a loop, each one covers the other's weakness.

Why we build the two together

Better training data

Quantum results replace approximate data in AI training sets

Less overhead

AI removes the setup work in front of every quantum run

Larger systems

Quantum is used only on the part the AI finds hardest

Each cycle helps the next

Every exact result becomes training data for the next model

Co-design in practice: chemistry on a quantum computer

A quantum computer cannot simulate a molecule until a circuit is built for it. Our AI writes that circuit.

Predicted vs exact strength of the electron interactions, on molecules never seen in training
